

Drawing Sets Demystified: A Beginner's Guide

By: Alina Zahid

Who am I?

- Alina Zahid
 - Completed my 2a of Architectural Engineering
 - Working for the Idea's Clinic as a Co-op student
-

–Why are Drawing Sets Important?

“Drawing sets are like a universal language between disciplines that helps explain the concept of your idea.”

What are Drawing Sets Composed of?

Plans

Elevations

Sections

Axonometric

Details

USEFUL drawings

How to Start?

Drawing sets are perfected near the end of the project. To start:

- Focus on creating your concept and perfecting it through crits.
- Then, developing the final project in CAD, consider each component you think is important to convey your project.
- Include MEANINGFUL drawings.

Title Block Template

1. Logo
2. Some legal Gargan
3. REV, ISSUE, DATE
4. **Group number with your names**
5. **Units used in drawings (often mm)**
6. **Name of your project and the location below it (location i.e. the site)**
7. **Drawings name (i.e., section, detail)**
8. Project number (in this case group number)
9. **Scale of the drawing!!**
10. **Drawing/Sheet Number**

GROUP 16 Maansi Sangha Alina Zahid Kevin Ye Wint Naing Elisa Gabriele	
Units: mm	
Super Shed Waterloo, ON	
Title: Cover Page	
Project No. 0016	Scale
Drawing No. A000	

Scaling Up

Small building you want LARGER -> Take the original units and MULTIPLY to make larger

Ex. 20:1

20cm → 1cm

The drawing is 20× larger than the real object.

- If a real object is 1 cm long, it would appear as 20 cm on the drawing.
- If the first number is larger than the second number (5:1, 2:1), the drawing is enlarged.

Scaling Down

Large building you want SMALLER-→ Take the original units and DIVIDE to make smaller

Ex. 1:20

The drawing is 20× smaller than the real object.

- If a real object is 20 cm long, it would appear as 1 cm on the drawing.
- If the first number is smaller than the second number (1:50, 1:100), the drawing is reduced.

Tips on Scaling

- Scale is written as **Drawing : Real Life**.
- Think of the scale relative to your original units,
i.e. if I had 1 cm and want it bigger... if I had 20cm and want it to be smaller...
- If both numbers are equal (1:1), the drawing is full size.
- Use standards scales: (Keep consistent units throughout scaled drawings)
- ❖ If the first number is larger than the second number (5:1, 2:1), the drawing is enlarged.
- ❖ If the first number is smaller than the second number (1:50, 1:100), the drawing is reduced.

Standard Scales

Scale	Typical Use
1:1	Full-size details
1:5	Construction details
1:10	Large details
1:20	Wall sections
1:50	Floor plans
1:100	Building plans
1:200	Site plans

Standard Sheet Numbers

Sheet Series	Content
A000	Cover Sheet / Title Page, Renderings
A100	Site Plans, Floor Plans, Plans
A200	Elevations
A300	Sections, Axonometrics
A400	Details

NOTE: There is no single universal numbering system. The key is to be logical, consistent, and easy to navigate.

Supershed Ex!

Thank you!
